

85-2442

Air/Fuel Monitor

This instrument is for use on vehicles with an existing oxygen sensor in the exhaust system. If there is no oxygen sensor on the vehicle, use P/N 85-2437 or 85-2441 (complete kit with sensor). The oxygen sensor is also available separately (P/N 85-2438).

This instrument continually monitors the air/fuel ratio of an engine while it is running. It is extremely sensitive to air/fuel ratio changes and will show them instantly and accurately.

This instrument works whether the engine is carbureted or fuel injected, normally aspirated, turbocharged, or supercharged, at any load condition. This instrument also works with nitrous oxide, but will not work with diesel or nitromethane fuels.
