

NOTE: strip insulation a suitable additional length such that this wire can be doubled for additional bulk for a secure crimp.

NOTE: where this symbol is used, it shall mean that it is the installer's responsibility to insure that a local ground is established near the indicated location.

CAUTION: do not "daisy chain" the black ground wires from each light as supplied as each wire is only adequate to ground one light. EITHER: ground each light separately, OR connect each individual light to a length of black 12 Ga. wire (supplied in kit) and ground this 12 Ga. wire at a single point.

NOTE: for a 4 light system, remove the 15 amp fuse (supplied) and replace with a fuse rated at 25 amps.

NOTE: in the event that the 12 Ga. 3/8" ring terminal (supplied) is not compatible with the vehicle's battery cable clamp bolt, installer must supply compatible 12 Ga. terminal and attach to battery cable clamp bolt.
