PRO COMP SUSPENSION

Suspension Systems that Work!

Part # 51007/51007MX
6" Lift
2007 Chevrolet
Silverado 4WD Kit
W/out Front Driveshaft

This document contains very important information that includes warranty information and instructions for resolving problems you may encounter. Please keep it in the vehicle as a permanent record.

Box 1 of 6-PN 51007/51007MX-1

Part #	Description	Qty.	Illus.	Page
90-6299	HARDWARE PACK: Rear Brake Line	1	-	-
70-0311001500	5/16" X 1" GR.5 HEX BOLT	2	-	-

Important!

- Front end and head light realignment is necessary!
 - Speedometer and ABS recalibration will be necessary if larger tires (10% more than stock diameter) are installed.
- ⇒ Due to differences in manufacturing, dimensions and inflated measurements, tire and wheel combinations should be test fit prior to installation. Tire and wheel choice is crucial in assuring proper fit, performance, and the safety of your Pro Comp equipped vehicle. For this application, we recommend a 17" or larger wheel not to exceed 8" in width with a maximum backspacing of 5" must be used. Additionally, a quality tire of radial design, not exceeding 35" tall X 12.5" wide is also recommended. Please note that the use of a 35" X 12.5" tire may require modification to the front valance. Violation of these recommendations will not be endorsed as acceptable by Pro Comp Suspension and will void any and all warranties either written or implied.

Before You Begin:

- ⇒ Read the instructions and study the illustrations before attempting the installation.
- ⇒ Separating the parts according to the areas where they will be used and placing the hardware with the brackets before you begin will save installation time.
- ⇒ Check the parts and hardware against the parts list to assure that your kit is complete.
- ⇒ ALWAYS wear safety glasses when using power tools or working beneath your vehicle.
- ⇒ Always use NEW cotter pins on re-assembly! (These items are NOT supplied)

Introduction:

- ◆ This installation requires a professional mechanic!
- ◆ We recommend that you have access to a factory service manual for your vehicle to assist in the disassembly and reassembly of your vehicle. It contains a wealth of detailed information.
- ◆ Ensure that your work space is of adequate size and the work surface is level. Place the vehicle in neutral. Place your floor jack under the front cross member and raise vehicle. Place jack stands under the frame rails behind the front wheel wells and lower the frame onto the stands. Remove the jack and place the vehicle back in gear, set the emergency brake, and place blocks both in front and behind the rear wheels.
- ◆ Prior to installation, carefully inspect the vehicle's steering and driveline systems paying close attention to the tie rod ends, ball joints, wheel bearing preload, pitman and idler arm. Additionally, check steering-to-frame and suspension-to-frame attaching points for stress cracks. The overall vehicle must be in excellent working condition. Repair or replace all worn or damaged parts!
- ◆ Read the instructions carefully and study the illustrations before attempting installation! You may save yourself a lot of extra work.
- ◆ Check the parts and hardware against the parts list to assure that your kit is complete. Separating parts according to the areas where they will be used and placing the hardware with the brackets before you begin will save installation time.
- ◆ Check the special equipment list and ensure the availability of these tools.
- ◆ Secure and properly block vehicle prior to beginning installation.
- ◆ ***ALWAYS*** wear safety glasses when using power tools or working under the vehicle!
- ◆ Use caution when cutting is required under the vehicle. The factory undercoating is flammable. Take appropriate precautions. Have a fire extinguisher close at hand.
- ◆ Foot pound torque readings are listed on the Torque Specifications chart at the end of the instructions. These are to be used unless specifically directed otherwise. Apply Loctite[®] retaining compound where specified.
- ◆ ***Please note that while every effort is made to ensure that the installation of your Pro Comp lift kit is a positive experience, variations in construction and assembly in the vehicle manufacturing process will virtually ensure that some parts may seem difficult to install. Additionally, the current trend in manufacturing of vehicles results in a frame that is highly flexible and may shift slightly on disassembly prior to installation. The use of pry bars and tapered punches for alignment is considered normal and usually does not indicate a faulty product. However, if you are uncertain about some aspect of the installation process, please feel free to call our tech support department at the number listed on the cover page. We do not recommend that you modify the Pro Comp parts in any way as this will void any warranty expressed or implied by the Pro Comp Suspension company.***

SPECIAL EQUIPMENT

Please refer to your service manual for more information. These tool may be purchased at your local GM dealer.

1. A special removal tool is required for safe removal of the tie rods. (Tie rod puller # **J6627-A**)
2. A special removal tool is required for safe removal of the ball joints. (Ball joint separator tool # **J23742**)

You may be able to rent any of these tools at your local parts store.

Optional Equipment Available from your Pro Comp Distributor!

51104: SKID PLATE

51105: SKID PLATE w/o LOGO

51207MX: MX-6 COIL OVER UPGRADE KIT

Also, check out our outstanding selection of Pro Comp tires to compliment your new installation!

FRONT INSTALLATION:

1. Position your vehicle on a smooth, flat, hard surface (i.e. concrete or asphalt). Block the rear tires and set the emergency brake.
2. Measure and record the distance from the center of each wheel to the top of its fender opening. Record below.

LF: _____ RF: _____

LR: _____ RR: _____

3. Place the vehicle in neutral. Place your floor jack under the front axle and raise the vehicle. Place jack stands under the frame rails and lower the frame onto the stands. Remove the jack and place the vehicle back in gear, set the emergency brake, and place blocks both in front and behind the rear wheels.
4. Remove the front wheels from the vehicle.
5. Unclip the ABS bracket from coil bucket and A-arm. Unplug the ABS connector.
6. Unbolt the ABS strap from the steering knuckle. Secure the ABS wire out of the work area. Discard the bracket.
7. Using pliers carefully open the a-arm brake line retaining bracket. Remove the rubber brake hose from the bracket. Using a cut off wheel, cut the bracket at the bend.
NOTE: Be very careful to not damage the rubber line in any way during it's removal from the bracket.
8. Unbolt the brake line bracket from the upper A-arm.
9. Using the proper tool carefully separate the outer tie rod end from the knuckle.
10. Remove the brake caliper and caliper bracket assembly and the rotor. Secure them clear from the work area. **DO NOT** let the caliper hang by the brake line or damage may result.
11. Mark the orientation of the sway bar and remove it from the vehicle.
12. Unbolt and remove the sway bar end links from the vehicle.

13. Unbolt the CV axle from the differential.
14. Using the proper tool carefully separate the upper ball joint from the knuckle. Loosen but **DO NOT** remove the retaining nut from the upper ball joint.
15. Support the lower control arm with a jack and unbolt the lower strut mounting bolts from the lower control arm mount.
16. Unbolt the lower control arm retaining bolts
17. Unbolt the previously loosened upper ball joint retaining nut and remove the lower control arm, knuckle and CV axle assembly from the vehicle.
18. Remove the clips that hold the ABS wire to the upper strut mounting studs.
19. Unbolt the nuts on the upper strut mounting studs. Carefully remove the strut from the vehicle.
20. Unbolt the front driveshaft from the differential and secure it out of the way of the work area. Save the hardware for reuse.
21. Unplug the differential wiring harness clips and vent tube.

22. Remove the factory rear crossmember support brace from the vehicle and discard. See ILLUSTRATION 1.

23. Support the differential with a jack and unbolt the driver and passenger side mounts (2 per side). Carefully remove the differential from

the vehicle.

24. On the driver side **ONLY**, measure out from the edge of the rear factory crossmember brace mount approximately 3" and scribe a line. See ILLUSTRATION 2.

25. Using a suitable cutting tool, (abrasive cutoff wheel, Sawz-all, etc.) cut the frame along the previously marked lines as shown in ILLUSTRATION 2.

26. Assemble the front differential support bracket (90-3692) using the supplied bushings (15-11148) and sleeves (90-2108) from hardware pack (90-6515). See ILLUSTRATION 3.

27. Rotate the front differential until the case bolt heads are oriented up. Carefully remove the factory bolts from the differential as shown in ILLUSTRATION 3.

NOTE: You will probably notice some differential oil seeping from the area where the bolts are removed. This is normal and not something to worry about.

If you do not stand the differential as directed, you will see a LOT more oil on your floor.

28. Place front differential support bracket (90-3692) on the front differential as shown in ILLUSTRATION 3. Secure support bracket using the supplied 10mm X 60mm bolts and washers, 7/16" X 3" bolt and hardware from pack 90-6251. Torque these fasteners to 32 ft. lbs. See ILLUSTRATION 3.

29. Install the driver side differential drop (90-3701) into the factory frame location using the OE bolts and hardware. Hand tighten only. ILLUSTRATION 4.

30. Using the OE hardware, install the passenger side differential drop (90-3704) to the factory frame location as shown in ILLUSTRATION 5.

IMPORTANT: The bracket is slightly tapered. The short end of the taper is oriented toward the rear of the vehicle.

31. Secure the differential to the previously installed drop brackets (90-3701 Drvr and 90-3704 Pass) using the supplied hardware. Snug

all differential mounting hardware to secure the differential location at this time, but ***DO NOT*** torque at this time. See ILLUSTRATIONS 6.

32. Check clearance between the differential and the trimmed area of the frame. If needed, remove more material until adequate clearance is achieved.
33. After verifying there is an adequate amount of clearance, thoroughly clean and paint the trimmed areas with a good quality paint to prevent rust.
34. Install the front crossmember (90-3684) into the front mounting pockets by sliding one end of the crossmember into the driver side mounting pocket from the outside. Push the installed end of the crossmember as far as it will go to the passenger side in the mounting pocket. Swing the crossmember up into the passenger side pocket. Center the crossmember in the mounting pockets and secure using the OE bolts. See ILLUSTRATION 7.

NOTE: ***DO NOT*** cut the front crossmember frame mounting pockets.

35. Install the front differential tabs (90-3691), from hardware pack (90-6516), to the upper holes in the welded mounting tabs on the front crossmember using the supplied 5/16" X 1" bolts and hardware. See ILLUSTRATION 8.

NOTE: ***Be sure to bolt the tabs (90-3691) to the outside of the welded crossmember mounting tabs.***

36. Secure the diff mount tabs to the front differential support bracket (90-3692) using the using the 9/16" X 4" bolt and hardware.
37. Install the rear crossmember (90-3688) into the rear mounting pockets using the OE bolts. See ILLUSTRATION 9.

NOTE: ***Be sure to check for clearance against the frame.***

38. Reinstall the front driveshaft to the front differential using the previously removed OE hardware.
39. Reattach the wiring harness, wiring clips and the vent tube to the differential.

IMPORTANT: Secure the vacuum line out of the way of the steering rack.

NOTE: The differential vent tube may need to be carefully pulled down to provide more slack for it's new mounting position.

40. Unbolt the CV axle retaining nut and remove the CV axle from the **OE** knuckle.
41. Separate the knuckle from the lower control arm and remove the **OE** knuckle.
42. Disassemble the **OE** knuckle on your work bench, remove the bearing hub assembly from the **OE** knuckle by removing the **OE** bolts. Save the mounting bolts, bearing, and dust shield for re-use. Discard the **OE** knuckles.
43. Reassemble the bearing hub and brake dust shields into the new Pro Comp steering knuckle (**90-4156 Drvr** and **90-4157 Pass**). Make sure that the ABS wiring is oriented in exactly the same position as it came from the **OE** knuckle and out of the way of the tire.
44. Torque the bearing to the knuckle with the **OE** bolts. Torque to 133 ft./lbs. Repeat on the other side.
45. Install the lower A-arms into the crossmember mounting pockets. Secure using the supplied **5/8" X 4 1/2"** bolts and hardware in the front pocket and the supplied **5/8" X 5 1/2"** bolts and hardware in the rear pocket.
46. Install the new knuckle to the lower ball joint. Torque the lower ball joint nut 74 ft./lbs.
47. Slide the CV spacer ring (**90-3809**) onto the

splined end of the outer CV axle. Be sure that the tapered end of the ring is facing toward the inside of the axle. Slip the CV axle through the bearing hub in the knuckle from the inside.

48. Secure the CV axle and the CV spacer (90-4077) to the differential using the supplied 10mm X 60mm bolts and washers. See ILLUSTRATION 11.
49. Install the new knuckle to the upper ball joint. Start the nut and leave hand tight until Coil over installation is complete.
50. Reinstall the CV shaft washer and retaining nut to CV axle. Torque this nut to factory specifications. (See your GM service manual for details)
51. **WITH THE COIL OVERS**, insert the mono

ball spacers (90-2433) from pack (90-6492) in the top of the coil over as shown in ILLUSTRATION 12.

NOTE: *The spacers are a tight fit. A press might be needed to fit the spacers into the mono balls.*

52. Install the new Pro Comp coil over shock (624000) to the coil over mount upper bracket (90-3712) with the supplied 1/2" X 2 3/4" hardware from hardware pack (90-6318).
53. Install the 1/4" spacer (90-3956) onto the upper coil over mount upper bracket studs. See ILLUSTRATION 12.

NOTE: *Be sure that the locating tab on the coil spacer is facing toward the outside of the*

vehicle.

54. Fasten upper bracket to the vehicle using the supplied $7/16$ " hardware on the top from hardware pack (90-6317) and torque to 45-50 ft./lbs. See ILLUSTRATION 12.
55. Secure the lower coil over shock cross pin to the lower A-arm using the supplied $7/16$ " X 2 $1/2$ " bolts and hardware. Torque according to the chart on page 19. See ILLUSTRATION 12.

NOTE: Supplemental instructions for MX coil over installation are located in box 51007BMX-6/51207BMX-1.

56. **WITH THE STRUT SPACERS**, attach the strut spacer (90-2614) to the top of the strut using the OE hardware. Torque to manufacturers specifications.
57. Fit the strut and spacer assembly into the stock mounting locations. Fasten using the supplied hardware on the top from hardware pack (90-6317) torque to 45-50ft./lbs. See ILLUSTRATION 5.

NOTE: Be sure that the locating tab on the top ring of the strut spacer is facing toward the outside of the vehicle.

58. Secure the lower strut cross pin to the lower A-arm using the OE bolts. Torque the bolts according to the manufacturers specifications. See ILLUSTRATION 5.
59. Repeat 51 through 55 (for use with coil over) or 56 through 58 (for use with OE strut) on the remaining side of the vehicle.
60. Torque the upper ball joint nut to 37 Ft./lbs.
61. Be sure to re-clip the previously removed upper strut mount wiring away from any moving parts, steering shaft or exhaust manifolds.

62. Work on one side of the vehicle at a time.

63. Torque all the differential, upper crossmember bolts and coil over hardware according to the torque chart on page 19 or to factory specifications. **DO NOT** torque the lower A-arm until the vehicle is on the ground.

64. Unbolt the rubber brake line bracket from the upper coil bucket. Discard the OE bolt.

65. Unclip the OE metal brake lines from the frame clips and carefully bend to provide enough slack in the line for it's new position.

NOTE: Be sure that the metal lines do not rub or contact anything.

66. Install the brake line relocation bracket (90-3573 **drv**r and 90-3574 **pas**s) to the existing holes in the rear of the upper control arm pocket using the (2) supplied 1/4" X 1" bolts and hardware. See ILLUSTRATION 14.

67. Bolt the brake line to the previously installed relocation bracket using the supplied 5/16" X 1" bolt. See ILLUSTRATION 14.

68. Reinstall the rotors and brake calipers to the new knuckle using the previously removed OE bolts. Be sure to use thread locker on the caliper bracket mounting bolts. Torque to factory specifications.

NOTE: It may be necessary to carefully

bend the caliper banjo fitting slightly up to provide adequate slack for the brake line. Be very careful not to damage the banjo fitting or brake line in any way. Check tightness of banjo bolt after modification.

69. Route the ABS wire through the factory clips on the upper A-arm. Zip tie the ABS line to the previously installed brake line bracket. See ILLUSTRATION 14.

70. Reattach the ABS wiring and secure it to the top hole on the knuckle using the supplied Adel clamp and supplied OE bolt and washer. See ILLUSTRATION 14.

NOTE: The Adel clamp has a flat side and a rounded side, make sure the flat side is facing out toward the tire.

71. On both sides of the vehicle loosen the jam nut and remove the outer tie rod ends and jam nuts.

72. The inner and outer tie rod ends may need to be shortened. Measure in 9/16" from the end of the inner tie rod end and scribe a line. Measure in 1/2" from the end of the outer tie rod end and scribe a line. Using a suitable cutting tool, (abrasive cutoff wheel, Sawz-all, etc.) cut the ends along the previously marked line. Be sure the cut is made straight and square or else the jam nut will not hold it's torque properly.

73. Reinstall the outer tie rod ends onto the inner tie rod ends. Thread them on as far as they will go with the stud facing down.
74. Insert from the top and secure the tie rod end to the knuckle and torque to factory specifications. Be sure to clean the threads and use thread locking compound on the tie rod end nut.
75. Install the sway bar drop brackets (**90-3632 drvr** and **90-3635 pass**) to the original sway bar mounting holes in the frame, angled toward the rear of the vehicle, using the supplied **10mm-1.5 X 30mm** bolts and hardware. See ILLUSTRATION 15.
76. Using the previously made sway bar orientation markings as a guide, flip the sway bar **180** degrees and reinstall it to the sway bar drop brackets using the supplied **7/16" X 2 1/2"** bolts and hardware. Leave hardware loose at this time. See ILLUSTRATION 15.
77. Install the previously removed **OE** sway bar end links into their original location on the lower A-arms. See ILLUSTRATION 15.
78. Reconnect the sway bar end links to the sway bar.
79. Torque the sway bar hardware according to the torque chart on page 19.
80. Install the bushings (**15-11148**) and sleeves (**90-2109**) from hardware pack (**90-6263**) into the compression struts (**90-2319**).
81. Using the existing outer holes attach the compression strut mounts (**90-1104**) to the transmission crossmember. Use the supplied **1/2" X 1 1/2"** bolt and nut plate (**90-3353**) to secure the mounts to the crossmember. See ILLUSTRATION 16.
82. Rotate the compression struts up and secure them to the crossmember mounts using the supplied **1/2" X 4"** bolt and hardware. See ILLUSTRATION 16.
NOTE: The wires can be trimmed off the end of the comp strut nut plates at this time.
83. Torque compression strut hardware according to the torque chart on page 19.
84. On both sides of the vehicle, check the routing of the brake lines and the ABS wire harnesses. There must be no pinching, rubbing, or stretching of either component. Use zip ties to secure these items to the steering components. At full droop, cycle the steering from lock to lock while observing the reaction of these components. Reposition them if needed.
85. With the front wheels installed cycle the steering from lock to lock to check to make sure the front wheels have enough clearance in the wheel well. If the wheel contacts the front or rear of the wheel well some trimming will be necessary. Check the caliper banjo fitting to ensure the line has the proper amount of slack.
NOTE: Remove OE rotor/drum retaining clips from wheel studs before installing the wheels.
86. Lower the vehicle to the ground. Torque the lug nuts according to the wheel manufacturers recommendations.
87. With the truck on the ground torque the lower A-arm bolts according to the torque chart on page 19.
88. Center the steering wheel and lock it in place. Set the toe by adjusting the tie rod ends properly.
IMPORTANT!: If the steering wheel is not centered properly it will trigger the anti-lock brake and traction control warning lights.
89. Recheck all hardware for proper installation and torque at this time.
IMPORTANT! BE SURE TO BRING THE VEHICLE IMMEDIATELY TO A REPUTABLE ALIGNMENT SHOP TO BE ALIGNED!

NOTES:

- ⇒ **On completion of the installation, have the suspension and headlights re-aligned.**
- ⇒ **After 100 miles recheck for proper torque on all newly installed hardware.**
- ⇒ **Recheck all hardware for tightness after off road use.**

REAR INSTALLATION:

51007/51007MX
Revised
5.15.08

1. Raise the rear of the truck enough for the tires to clear the ground and use jack stands on the frame to support the truck. Remove the rear tires and wheels.
2. Carefully remove the **OE** shock absorbers. It may be necessary to raise the differential housing slightly to facilitate their removal.
3. Unbolt the driver side emergency brake line hanger from the frame rail. Save the **OE** bolt for reuse.
4. Unclip the rubber ABS line from the frame rails.
5. Unbolt the rear brake line bracket from the rear axle differential housing. Save the **OE** bolt for

reuse.

6. One side at a time, support the differential housing on the side being modified. Remove the “U” bolts from that axle end and discard. Carefully lower the differential away from the **OE** springs. Remove and discard the **OE** riser block from its mount pad. Take careful note of the position of the factory spring packs.

ADD-A-LEAF (13127-1) INSTALLATION

NOTE: In order to properly install the add-a-leaf spring, it will be necessary to contain the elasticity in the leaf spring with “C” clamps when the center bolt is removed. Some springs have a factory helper spring consisting of one or more flat leaves installed at the bottom of the leaf pack. **DO NOT** install the add-a-leaf spring in or

below the helper spring.

7. Hold the spring assembly securely together with “C” clamp. If necessary remove any spring leaf alignment clamps. Remove the spring center bolt. A hammer and drift punch may be used to drive it out if necessary.

8. Carefully remove “C” clamps and lay unassembled leaves aside.

NOTE: Add-a-leaf will be placed in the spring assembly progressively according to length. For example, if the existing leaves are 32” long and 25” long and the add-a-leaf is 28” long, place the add-a-leaf between the existing leaves.

9. Apply a small amount of grease to the end of the add-a-leaf, place it in the spring assembly as described in the note above, and reassemble the leaf springs using the “C” clamps. Insert the new center bolt (97-380) and the (2 *per side*) 5/16” spacer plate (90-3957) under the factory overload spring. Torque the center bolt nut to 20 ft./lbs. With a hacksaw, cut the center bolt even with the top of the nut. **NOTE: The short side of the spacer will face toward the front of the vehicle.**

10. Loosely assemble the complete spring assemblies into their respective axle mounts. As shown in **ILLUSTRATION 19**, place the 4” (95-400) blocks in position. Make sure the pin in the block is in the hole of the axle housing spring pad. The short end of the block goes toward the front of the vehicle. Install the block so the pinion moves up.

11. Install the new “U” bolts (13-90087) over the leaf spring assembly and using the new washers and nuts supplied along with the existing spring plates, torque the U-bolt nuts to 105 ft./lbs. See **Illustration 19**.

12. Repeat these steps on the other side of the vehicle.

13. Reattach the emergency brake line hanger to the frame rail using the previously removed OE bolt.

14. Bolt the rear brake line extension bracket (90-

3341) to the rear axle differential housing using the previously removed OE bolt.

15. Carefully rotate the rubber brake line factory bracket assembly toward the rear of the vehicle and bolt it to the newly installed extension bracket (90-3341) using the supplied 5/16” X 1” bolt and hardware from pack (90-6299).

NOTE: Be sure that the metal lines do not rub or contact the rear end housing.

16. Before installing your new Pro Comp shock absorbers, it is necessary that you check for adequate clearance. Temporarily install your Pro Comp shocks (928001 or MX6098) into the shock mounts. Carefully check for clearance issues. If there are areas that come in contact with or are very close to your new shocks, carefully remove sufficient material to ensure trouble free operation. Pay particular attention to the area around the lower shock mount. When all clearance issues have been resolved, install your new Pro Comp shock absorbers and recheck all fasteners for proper installation and torque. You can install only the MX6 shocks either shaft up or shaft down.

17. Install your wheels and tires and lower the vehicle to the ground.

NOTE: Remove OE rotor/drum retaining clips from wheel studs before installing the wheels.

18. After installation is complete, double check that all nuts and bolts are tight. Refer to the chart at the end of this document for torque specifications. (Do not retighten nuts and bolts where thread locking compound was used).

NOTES:

- ⇒ **On completion of the installation, have the suspension and headlights re-aligned.**
- ⇒ **After 100 miles recheck for proper torque on all newly installed hardware.**
- ⇒ **Recheck all hardware for tightness after off road use.**
- ⇒ **If upon completion the vehicle sit higher than desired, height can be taken out by removing one of the 5/16” spacers from the rear spring pack.**

Final notes:

1. If new tires are installed that are more than 10% taller than original tires, the speedometer must be recalibrated for the rear wheel anti-lock brake system to function properly. Contact an authorized GM dealer for details on recalibration.
2. With vehicle on the floor, cycle the steering from lock to lock and inspect the steering, suspension and driveline systems for proper operation, tightness and adequate clearance. Recheck brake hose/fittings for leaks. Be sure all brake lines are long enough for safe operation.
3. Have headlights readjusted to the proper settings.
4. Realign front end to factory specifications. Be sure the vehicle is at the desired ride height prior to realignment.
5. Recheck ALL fasteners at 100 miles to make sure they have not come loose. Due to the additional wear and tear created by larger tires and wheels, we recommend that you periodically check the suspension system and steering components to ensure service life and safe vehicle operation.

Notice to Owner operator, Dealer and Installer:

Vehicles that have been enhanced for off-road performance often have unique handling characteristics due to the higher center of gravity and larger tires. This vehicle may handle, react and stop differently than many passenger cars or unmodified vehicles, both on and off-road. You must drive your vehicle safely! Extreme care should always be taken to prevent vehicle rollover or loss of control, which can result in serious injury or even death. Always avoid sudden sharp turns or abrupt maneuvers and allow more time and distance for braking! Pro Comp reminds you to fasten your seat belts at all times and reduce speed! We will gladly answer any questions concerning the design, function, maintenance and correct use of our products.

Please make sure your Dealer/Installer explains and delivers all warning notices, warranty forms and instruction sheets included with Pro Comp product.

Application listings in this catalog have been carefully fit checked for each model and year denoted. However, Pro Comp reserves the right to update as necessary, without notice, and will not be held responsible for misprints, changes or variations made by vehicle manufacturers. Please call when in question regarding new model year, vehicles not listed by specific body or chassis styles or vehicles not originally distributed in the USA.

Please note that certain mechanical aspects of any suspension lift product may accelerate ordinary wear of original equipment components. Further, installation of certain Pro Comp products may void the vehicle's factory warranty as it pertains to certain covered parts; it is the consumer's responsibility to check with their local dealer for warranty coverage before installation of the lift.

Warranty and Return policy:

Pro Comp warrants its full line of products to be free from defects in workmanship and materials. Pro Comp's obligation under this warranty is limited to repair or replacement, at Pro Comp's option, of the defective product. Any and all costs of removal, installation, freight or incidental or consequential damages are expressly excluded from this warranty. Pro Comp is not responsible for damages and / or warranty of other vehicle parts related or non-related to the installation of Pro Comp product. A consumer who makes the decision to modify his vehicle with aftermarket components of any kind will assume all risk and responsibility for potential damages incurred as a result of their chosen modifications. Warranty coverage does not include consumer opinions regarding ride comfort, fitment and design. Warranty claims can be made directly with Pro Comp or at any factory authorized Pro Comp dealer.

IMPORTANT! To validate the warranty on this purchase please be sure to mail in the warranty card.

Claims not covered under warranty-

- Parts subject to normal wear, this includes bushings, bump stops, ball joints, tie rod ends and heim joints
 - Discontinued products at Pro Comp's discretion
- Bent or dented product
- Finish after 90 days
- Leaf or coil springs used without proper bump stops
- Light bulbs
- Products with evident damage caused by abrasion or contact with other items
- Damage caused as a result of not following recommendations or requirements called out in the installation manuals
- Products used in applications other than listed in Pro Comp's catalog
- Components or accessories used in conjunction with other manufacturer's systems
- Tire & Wheel Warranty as per Pro Competition Tire Company policy
- Warranty claims without "Proof of Purchase"
- Pro Comp Pro Runner coil over shocks are considered a serviceable shock with a one-year warranty against leakage only. Rebuild service and replacement parts will be available and sold separately by Pro Comp. Contact Pro Comp for specific service charges.
- Pro Comp accepts no responsibility for any altered product, improper installation, lack of or improper maintenance, or improper use of our products.
